SQP-methods and POD for optimal control of quasilinear parabolic PDE

Abstract:

Recently, optimal control of quasilinear parabolic equations has been addressed by Casas, Chrysafinos (2018) resp. Bonifacius, Neitzel (2018). Based on the theoretical fundament developed in the latter paper I will discuss theoretical and numerical aspects of the SQP-method for the numerical solution of these nonlinear optimal control problems. In particular, POD model reduction seems to be a promising strategy to speed up the computations.
